

AeroStar is Defining NEW Industry Standards of Leadership in Health, Wellness and Confidence in Air Travel

Aerostar and Microgerm Defense of Nevada are proud to announce a strategic alliance to improve the safety of the airline travel and cargo transport sectors. Their consolidated efforts will focus on fighting against cross contamination of bacteria and other harmful pathogens including viruses within the main cabin, cockpit, lavatory and all transport/cargo areas. "The partnership could not come at a better time to ensure the safety and well-being of airline personnel and customers during the COVID-19 pandemic" says Greg Guzman, President of Aerostar and a 20+ year veteran of the Aerospace Industry. Gary Wilkos, Chief Operating Officer of Microgerm Defense, agrees. "It was a natural fit to align ourselves with Aerostar because of our shared passion for innovative solutions to current market challenges and the premium both companies place on safety and service."

While the application of disinfectants will continue to be a necessary step to ensure an aircraft is sanitized, Microgerm takes the process one step further with a shielding technology against pathogens and contaminants, coating all areas of the aircraft with a scientifically proven product that fights cross contamination. Hospitals, Hotels, Restaurants and the Airline and Transport industry are deploying this EPA registered and FDA approved chemistry which is helping protect travelers and employees at the highest level.

Aerostar is an industry leading 145 Repair Station and consultancy based in Mobile, AL, specializing in the repair and overhaul of hydraulic, pneumatic, electromechanical and power generation accessories. With its wide aerospace footprint and a primary customer base consisting of commercial airlines and the supply chain that supports them, Aerostar is defining new industry standards of leadership in health, wellness and confidence in air travel.

Microgerm Defense is national environmental organization headquartered in Las Vegas, NV specializing in the application of antimicrobial coatings. Microgerm applies an EPA registered and FDA approved chemistry using an electrostatic process that has been scientifically proven to lower microbe counts on surfaces and textiles and has proven effective on Covid-19 surrogates and other harmful bacteria and pathogens.
